Chapter 1

Main Page

Here's the documentation of the GUIDO Engine Library's Qt binding classes.

The architecture is divided in 3 levels :

- **Low level:** [GSystemQt](#), [GDeviceQt](#) & [GFontQt](#) are the Qt implementations of the GUIDO interfaces `VGSystem`, `VGDevice` & `VGFont`.
- **Medium level:** The [QGuidoPainter](#) is a wrapper that uses [GSystemQt](#), [GDeviceQt](#) & [GFontQt](#).
- **High level:** [QGuidoWidget](#) & [QGuidoGraphicsItem](#) are ready-to-use `QWidget`/`QGraphicsItem` displaying a GUIDO Score.

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

GDeviceQt (Qt implementation of the VGDevice interface, more precisely : a wrapper between the VGDevice and the QPainter objects)	5
GFontQt (Qt implementation of the VGFont interface)	5
GSystemQt (Qt implementation of the VGSystem interface)	6
Guido2Image (Offers functions to export GMN code (from a string or a file) to various formats of images, or to PDF)	6
QGuidoGraphicsItem (A QGraphicsItem displaying a Guido Score)	7
QGuidoImporter (An importer to support the MusicXML format)	11
QGuidoPainter (The QGuidoPainter object is a Qt encapsulation of the Guido Engine, basically allowing you to draw a Guido Score with a QPainter)	13
QGuidoWidget (A QWidget displaying one/several pages of a Guido Score) .	19
QPageManager (Arranges a set of pages in a grid)	24

Chapter 3

Class Documentation

3.1 GDeviceQt Class Reference

Qt implementation of the VGDevice interface, more precisely : a wrapper between the VGDevice and the QPainter objects.

```
#include <GDeviceQt.h>
```

3.1.1 Detailed Description

Qt implementation of the VGDevice interface, more precisely : a wrapper between the VGDevice and the QPainter objects.

Warning

Only the methods needed by the Guido Engine are implemented.

The documentation for this class was generated from the following files:

- GDeviceQt.h
- GDeviceQt.cpp

3.2 GFontQt Class Reference

Qt implementation of the VGFont interface.

```
#include <GFontQt.h>
```

Public Member Functions

- QFont * [GetNativeFont](#) () const

Returns the font associated with the current object.

- QChar [Symbol](#) (unsigned int sym) const

Returns the symbol corresponding to the input index.

3.2.1 Detailed Description

Qt implementation of the VGFont interface. More precisely : a wrapper between the VGFont interface and the QFont object.

The documentation for this class was generated from the following files:

- GFontQt.h
- GFontQt.cpp

3.3 GSystemQt Class Reference

Qt implementation of the VGSystem interface.

```
#include <GSystemQt.h>
```

3.3.1 Detailed Description

Qt implementation of the VGSystem interface. For now, among the VGDevice factory functions, only the CreateDisplayDevice works, but you can use the created VGDevice to draw with any QPainter anyway (QPrinter, QWidget, QImage ...), so you needn't the other factory functions.

The documentation for this class was generated from the following files:

- GSystemQt.h
- GSystemQt.cpp

3.4 Guido2Image Class Reference

Offers functions to export GMN code (from a string or a file) to various formats of images, or to PDF.

```
#include <Guido2Image.h>
```

Static Public Member Functions

- static const char * [getErrorString](#) (Guido2ImageErrorCodes err)
gives an error code textual description

- static Guido2ImageErrorCodes [gmString2Image](#) (const Params &p)
converts a gmn string to an image
- static Guido2ImageErrorCodes [gmFile2Image](#) (const Params &p)
converts a gmn file to an image
- static Guido2ImageErrorCodes [guidoPianoRoll2Image](#) (const Params &p, PianoRoll *pianoRoll, int width, int height)
converts a gmn file to an image

3.4.1 Detailed Description

Offers functions to export GMN code (from a string or a file) to various formats of images, or to PDF.

The documentation for this class was generated from the following files:

- Guido2Image.h
- Guido2Image.cpp

3.5 QGuidoGraphicsItem Class Reference

A QGraphicsItem displaying a Guido Score.

```
#include <QGuidoGraphicsItem.h>
```

Public Member Functions

- [QGuidoGraphicsItem](#) (QGraphicsItem *parent=0)
Default constructor.
- virtual [~QGuidoGraphicsItem](#) ()
Destructor.
- virtual bool [setGMNFile](#) (const QString &fileName)
Sets the current Guido Score file to draw.
- QString [fileName](#) () const
Returns the current Guido Score file.
- virtual bool [setGMNCode](#) (const QString &gmnCode, const QString &path=0)
Sets the current Guido code that will be displayed by the guido item.

- `QString gmnCode () const`
Returns the current Guido code.
- `bool isGMNValid () const`
Returns the validity of the last GMN code loaded with `setGMNCode` or `setGMNFile`.
- `QString getLastErrorMessage () const`
Returns a description of the last encountered error.
- `void getLastParseErrorLine (int &line, int &col) const`
Gets the parse error line/col.
- `virtual void setGuidoLayoutSettings (const GuidoLayoutSettings &layoutSettings)`

Sets the Guido layout settings used to draw with this `QGuidoPainter`.
- `GuidoLayoutSettings guidoLayoutSettings () const`
Returns the Guido layout settings of the `QGuidoPainter`.
- `void resetSystemsDistance ()`
sets the minimum systems distance to its default value
- `void setSystemsDistance (float distance)`
sets the minimum systems distance
- `float getSystemsDistance () const`
returns the minimum systems distance
- `void setResizePageToMusic (bool isOn)`
Disable/enable automatic `ResizePageToMusic`.
- `bool isResizePageToMusic () const`
Returns the state of the automatic `ResizePageToMusic` mode (enabled or disabled)
- `void setGuidoPageFormat (const GuidoPageFormat &pageFormat)`
Sets the page format used when no page format is specified by the GMN.
- `GuidoPageFormat guidoPageFormat () const`
Gets the page format used when no page format is specified by the GMN.
- `int pageCount () const`
Returns the number of pages of the Guido Score.
- `QSizeF pageSizeMM (int pageIndex) const`
Returns the size of a page (specified by its index), in millimeters.

- bool [setPage](#) (int pageIndex)
Sets the first displayed page of the Guido Score.
- void [setGridHeight](#) (int height)
Sets the number of the lines of the grid of pages.
- void [setGridWidth](#) (int width)
Sets the number of the columns of the grid of pages.
- int [gridHeight](#) () const
Returns the number of lines in the grid of pages.
- int [gridWidth](#) () const
Returns the number of columns in the grid of pages.
- int [firstVisiblePage](#) () const
Returns the first visible page index.
- int [lastVisiblePage](#) () const
Returns the last visible page index.
- CGRHandler [getGRHandler](#) () const
Gives access to the GRHandler (graphic representation) of the Score in read-only.
- CARHandler [getARHandler](#) () const
Gives access to the ARHandler (abstract representation) of the Score in read-only.
- void [setScoreColor](#) (const QColor &color)
sets the color used to draw the score
- const QColor & [getScoreColor](#) () const
returns the color used to draw the score

3.5.1 Detailed Description

A QGraphicsItem displaying a Guido Score. The Guido Score may be loaded via a QString containing the GMN code ([setGMNCode\(\)](#)), or via a QString containing the path to a GMN file ([setFile\(\)](#)).

The pages of the Guido Score will be displayed in a "grid of pages":

- you can specify the number of columns and lines of this grid with the [setGridHeight](#) / [setGridWidth](#) functions ;
- the pages are placed in the grid in increasing order of indexes ; the first page is at the top-left, the second page is placed at the right of the first page, and so on, until the end of the line, when it goes on on the next line ;

- you can specify the first (top left) displayed page with the `setPage` function.
- if the grid is too small to display all the Guido Score pages, it doesn't matter : other pages are simply not visible, and you have to use `setPage` to display them. See [QPageManager](#) for more details.

Warning

Don't forget to use `QGuidoPainter`'s static `startGuidoEngine` method before building any [QGuidoGraphicsItem](#), or else you'll have an assertion failed in the [QGuidoGraphicsItem](#) constructor.

3.5.2 Member Function Documentation

3.5.2.1 `QString QGuidoGraphicsItem::gmnCode () const`

Returns the current Guido code.

Note

This will work only if the code has been set with `setGMNCode`. If the code has been loaded via `setFile`, this will return "".

3.5.2.2 `QSizeF QGuidoGraphicsItem::pageSizeMM (int pageIndex) const`

Returns the size of a page (specified by its index), in millimeters.

The page format & size are defined in the GMN code.

3.5.2.3 `bool QGuidoGraphicsItem::setGMNCode (const QString & gmnCode, const QString & path = 0) [virtual]`

Sets the current Guido code that will be displayed by the guido item.

Parameters

<i>gmnCode</i>	The Guido Music Notation code
----------------	-------------------------------

Returns

true if the GMN code is valid.

3.5.2.4 `bool QGuidoGraphicsItem::setGMNFile (const QString & fileName) [virtual]`

Sets the current Guido Score file to draw.

Parameters

<i>fileName</i>	Full path to the Guido Score Notation file.
-----------------	---

Returns

true if the file is a valid Guido Score file.

Note

If any GMN code has been previously set, it will be erased.

3.5.2.5 void QGuidoGraphicsItem::setGuidoLayoutSettings (const GuidoLayoutSettings & layoutSettings) [virtual]

Sets the Guido layout settings used to draw with this [QGuidoPainter](#).

Note

You can have more informations on GuidoLayoutSettings in GUIDOlib documentation.

3.5.2.6 bool QGuidoGraphicsItem::setPage (int pageIndex)

Sets the first displayed page of the Guido Score.

Returns

True if the pageIndex is valid, false else.

The documentation for this class was generated from the following files:

- QGuidoGraphicsItem.h
- QGuidoGraphicsItem.cpp

3.6 QGuidoImporter Class Reference

An importer to support the MusicXML format.

```
#include <QGuidoImporter.h>
```

Static Public Member Functions

- static bool [musicxmlSupported](#) ()
- static const char * [musicxmlVersion](#) ()
- static const char * [musicxml2guidoVersion](#) ()
- static bool [musicxmlFile2Guido](#) (const char *file, bool generateBars, std::ostream &out)
converts a musicxml file to guido

- static bool [musicxmlString2Guido](#) (const char *str, bool generateBars, std::ostream &out)

converts a musicxml string to guido

3.6.1 Detailed Description

An importer to support the MusicXML format. The [QGuidoImporter](#) is a static object. When initialized, it checks for the libmusicml2 library, and when present, it loads the library and resolves musicxml to guido conversion entry points.

3.6.2 Member Function Documentation

3.6.2.1 const char * QGuidoImporter::musicxml2guidoVersion () [static]

Returns

the musicxml to guido converter version as a string

3.6.2.2 bool QGuidoImporter::musicxmlFile2Guido (const char * file, bool generateBars, std::ostream & out) [static]

converts a musicxml file to guido

Parameters

<i>file</i>	the musicxml file name
<i>generateBars</i>	a boolean to force or inhibit measures bar generation
<i>out</i>	the output stream

Returns

true when the conversion is successful

3.6.2.3 bool QGuidoImporter::musicxmlString2Guido (const char * str, bool generateBars, std::ostream & out) [static]

converts a musicxml string to guido

Parameters

<i>str</i>	the musicxml string
<i>generateBars</i>	a boolean to force or inhibit measures bar generation
<i>out</i>	the output stream

Returns

true when the conversion is successful

3.6.2.4 bool QGuidoImporter::musicxmlSupported () [static]**Returns**

true when the conversion methods are available

3.6.2.5 const char * QGuidoImporter::musicxmlVersion () [static]**Returns**

the musicxml lib version as a string

The documentation for this class was generated from the following files:

- QGuidoImporter.h
- QGuidoImporter.cpp

3.7 QGuidoPainter Class Reference

The [QGuidoPainter](#) object is a Qt encapsulation of the Guido Engine, basically allowing you to draw a Guido Score with a QPainter.

```
#include <QGuidoPainter.h>
```

Public Member Functions

- bool [setGMNFile](#) (const QString &fileName)
Sets the current Guido code to draw with the content of the file.
- const QString & [fileName](#) () const
Returns the last file loaded with setFile.
- bool [setGMNCode](#) (const QString &gmncode, const char *datapath=0)
Sets the current Guido code to draw.
- QString [gmncode](#) () const
Returns the current Guido code.
- bool [isGMNValid](#) () const
Returns the validity of the last GMN code loaded with setGMNCode or setGMNFile.

- int [pageCount](#) () const
Returns the number of page of the current Guido Score.
- void [draw](#) (QPainter *painter, int page, const QRect &drawRectangle, const QRect &redrawRectangle=QRect())
Draws the current Guido Score using the specified QPainter.
- void [drawPianoRoll](#) (QPainter *painter, const QRect &drawRectangle, PianoRoll *pianoRoll)
Draws the current Guido Score using the specified QPainter, under Piano Roll form.
- int [heightForWidth](#) (int w, int page) const
Returns the height corresponding to the specified width for the specified page, according to the page format.
- QSizeF [pageSizeMM](#) (int page) const
Returns the size of the specified page, in millimeters.
- QString [getLastErrorMessage](#) () const
Returns a description of the last encountered error.
- void [getLastParseErrorLine](#) (int &line, int &col) const
Gets the parse error line/col.
- void [setGuidoLayoutSettings](#) (const GuidoLayoutSettings &layoutSettings)
sets the guido layout settings
- GuidoLayoutSettings [guidoLayoutSettings](#) () const
returns the guido layout settings
- void [setScoreColor](#) (const QColor &color)
sets the color used to draw the score
- const QColor & [getScoreColor](#) () const
returns the color used to draw the score
- void [resetSystemsDistance](#) ()
sets the minimum systems distance to its default value
- void [setSystemsDistance](#) (float distance)
sets the minimum systems distance
- float [getSystemsDistance](#) () const
returns the minimum systems distance
- void [setResizePageToMusic](#) (bool isOn)

Disable/enable automatic ResizePageToMusic.

- bool [isResizePageToMusic](#) () const
Returns the state of the automatic ResizePageToMusic mode (enabled or disabled)
- void [setGuidoPageFormat](#) (const GuidoPageFormat &pageFormat)
Sets the page format used when no page format is specified by the GMN.
- GuidoPageFormat [guidoPageFormat](#) () const
Gets the page format used when no page format is specified by the GMN.
- CGRHandler [getGRHandler](#) () const
Gives access to the GRHandler (graphic representation) of the Score in read-only.
- CARHandler [getARHandler](#) () const
Gives access to the ARHandler (abstract representation) of the Score in read-only.
- void [setARHandler](#) (ARHandler ar)
Directly set the AR handler.

Static Public Member Functions

- static void [startGuidoEngine](#) ()
Initialize the GUIDO score engine.
- static QGuidoPainter * [createGuidoPainter](#) ()
Creates a new QGuidoPainter object.
- static void [destroyGuidoPainter](#) (QGuidoPainter *painter)
Destroys the specified QGuidoPainter.
- static void [stopGuidoEngine](#) ()
Stops the GUIDO score engine.

Static Protected Member Functions

- static bool [isGuidoEngineStarted](#) ()
Returns the GuidoEngine state : started or not.

3.7.1 Detailed Description

The [QGuidoPainter](#) object is a Qt encapsulation of the Guido Engine, basically allowing you to draw a Guido Score with a QPainter. You first specify the Guido Score file with the `setGMNFile` or `setGMNCode` methods, and then just call the `draw` method, specifying a QPainter, draw bounding rect, and a page index.

Note

[QGuidoPainter](#) constructor and destructor are protected. You must use the factory function `createGuidoPainter` to build one, and `destroyGuidoPainter` to destroy one. You must call `startGuidoEngine` and `destroyGuidoEngine` at the beginning and the end of your application.

Warning

You can NOT re-start the GuidoEngine once you've already stopped it.

3.7.2 Member Function Documentation

3.7.2.1 `QGuidoPainter * QGuidoPainter::createGuidoPainter ()` [static]

Creates a new [QGuidoPainter](#) object.

Returns

a pointer to the new [QGuidoPainter](#) object, or NULL if you didn't previously call the `startGuidoEngine` function.

3.7.2.2 `void QGuidoPainter::destroyGuidoPainter (QGuidoPainter * painter)` [static]

Destroys the specified [QGuidoPainter](#).

If the specified [QGuidoPainter](#) is NULL, does nothing.

Note

You mustn't call "delete" in your own application ; you have to use the `destroyGuidoPainter` function to avoid shared-library memory problems.

3.7.2.3 `void QGuidoPainter::draw (QPainter * painter, int page, const QRect & drawRectangle, const QRect & redrawRectangle = QRect ())`

Draws the current Guido Score using the specified QPainter.

The Guido Score won't be stretched and will keep its width/height ratio.

Parameters

<i>painter</i>	The QPainter to be used for the draw.
<i>page</i>	Index of the score page to draw (starts with 1).
<i>drawRectangle</i>	Specifies the zone of the QPaintDevice in which to draw.
<i>redrawRectangle</i>	(optionnal) Specifies the rectangle to be redrawn. A null redrawRectangle will redraw everything.

Note

drawRectangle and redrawRectangle are in QPainter's QPaintDevice coordinates.

3.7.2.4 void QGuidoPainter::drawPianoRoll (QPainter * *painter*, const QRect & *drawRectangle*, PianoRoll * *pianoRoll*)

Draws the current Guido Score using the specified QPainter, under Piano Roll form.

The Guido Score won't be stretched and will keep its width/height ratio.

Parameters

<i>painter</i>	The QPainter to be used for the draw.
<i>drawRectangle</i>	Specifies the zone of the QPaintDevice in which to draw.
<i>pianoRoll</i>	the current PianoRoll

Note

drawRectangle is in QPainter's QPaintDevice coordinates.

3.7.2.5 GuidoLayoutSettings QGuidoPainter::guidoLayoutSettings () const

returns the guido layout settings

See also

GUIDOEngine interface

3.7.2.6 int QGuidoPainter::heightForWidth (int *w*, int *page*) const

Returns the height corresponding to the specified width for the specified page, according to the page format.

The page format & size are defined in the Guido Score file.

3.7.2.7 bool QGuidoPainter::isGuidoEngineStarted () [static, protected]

Returns the GuidoEngine state : started or not.

3.7.2.8 QSizeF QGuidoPainter::pageSizeMM (int *page*) const

Returns the size of the specified page, in millimeters.

The page format & size are defined in the Guido Score file.

3.7.2.9 bool QGuidoPainter::setGMNCode (const QString & *gmnCode*, const char * *datapath* = 0)

Sets the current Guido code to draw.

Parameters

<i>gmnCode</i>	The Guido Music Notation code
----------------	-------------------------------

Returns

true if the GMN code is valid.

3.7.2.10 bool QGuidoPainter::setGMNFile (const QString & *fileName*)

Sets the current Guido code to draw with the content of the file.

Parameters

<i>fileName</i>	Full path to the Guido Score Notation file.
-----------------	---

Returns

true if the file is a valid Guido Score file.

3.7.2.11 void QGuidoPainter::setGuidoLayoutSettings (const GuidoLayoutSettings & *layoutSettings*)

sets the guido layout settings

See also

GUIDOEngine interface

3.7.2.12 void QGuidoPainter::startGuidoEngine () [static]

Initialize the GUIDO score engine.

You must call this function to be able to instantiate [QGuidoPainter](#) objects, or else the createGuidoPainter function will return NULL.

Note

Calling this function more than once doesn't affect the score engine.

3.7.2.13 void QGuidoPainter::stopGuidoEngine () [static]

Stops the GUIDO score engine.

Note

You must call the function at the end of your application to free the internal Guido score engine objects.

Warning

You mustn't call this function before every [QGuidoPainter](#) objects have been destroyed.

The documentation for this class was generated from the following files:

- QGuidoPainter.h
- QGuidoPainter.cpp

3.8 QGuidoWidget Class Reference

A QWidget displaying one/several pages of a Guido Score.

```
#include <QGuidoWidget.h>
```

Public Member Functions

- [QGuidoWidget](#) (QWidget *parent=0)
Constructor.
- bool [setGMNFile](#) (const QString &fileName)
Sets the current Guido Score file to draw.
- QString [fileName](#) () const
Returns the current Guido Score file.
- bool [setGMNCode](#) (const QString &gmncode, const QString &path)
Sets the current Guido code to draw.
- QString [gmncode](#) () const
Returns the current Guido code.
- bool [isGMNValid](#) () const
Returns the validity of the last GMN code loaded with setGMNCode or setGMNFile.
- int [pageCount](#) () const

Returns the number of pages of the current Guido Score.

- bool [setPage](#) (int pageIndex)
Sets the first displayed page of the Guido Score.
- void [setGridHeight](#) (int height)
Sets the number of the lines of the grid of pages.
- void [setGridWidth](#) (int width)
Sets the number of the columns of the grid of pages.
- int [gridHeight](#) () const
Returns the number of lines in the grid of pages.
- int [gridWidth](#) () const
Returns the number of columns in the grid of pages.
- int [firstVisiblePage](#) () const
Returns the first visible page index.
- int [lastVisiblePage](#) () const
Returns the last visible page index.
- int [heightForWidth](#) (int w) const
Returns the height corresponding to the specified width.
- QSizeF [pageSizeMM](#) (int page) const
Returns the size of the specified page, in millimeters.
- QString [getLastErrorMessage](#) () const
Returns a description of the last encountered error.
- void [getLastParseErrorLine](#) (int &line, int &col) const
Gets the parse error line/col.
- void [setGuidoLayoutSettings](#) (const GuidoLayoutSettings &layoutSettings)
Sets the Guido layout settings used to draw with this [QGuidoPainter](#).
- GuidoLayoutSettings [guidoLayoutSettings](#) () const
Returns the Guido layout settings of the [QGuidoPainter](#).
- void [resetSystemsDistance](#) ()
sets the minimum systems distance to its default value
- void [setSystemsDistance](#) (float distance)
sets the minimum systems distance

- float [getSystemsDistance](#) () const
returns the minimum systems distance
- void [setResizePageToMusic](#) (bool isOn)
Disable/enable automatic ResizePageToMusic.
- bool [isResizePageToMusic](#) () const
Returns the state of the automatic ResizePageToMusic mode (enabled or disabled)
- void [setGuidoPageFormat](#) (const GuidoPageFormat &pageFormat)
Sets the page format used when no page format is specified by the GMN.
- GuidoPageFormat [guidoPageFormat](#) () const
Gets the page format used when no page format is specified by the GMN.
- QSize [sizeHint](#) () const
QWidget implementation. See Qt doc on QWidget.
- CGRHandler [getGRHandler](#) () const
Gives access to the GRHandler (graphic representation) of the Score in read-only.
- CARHandler [getARHandler](#) () const
Gives access to the ARHandler (abstract representation) of the Score in read-only.
- void [setARHandler](#) (ARHandler ar)
Directly set the AR handler .
- void [setScoreColor](#) (const QColor &color)
sets the color used to draw the score
- const QColor & [getScoreColor](#) () const
returns the color used to draw the score
- void [clearCache](#) ()
Clears the widget's draw-cache, forcing it to redraw.

Protected Member Functions

- void [paintEvent](#) (QPaintEvent *event)
QWidget implementation.
- void [updateGuidoPagesSizes](#) ()
Must be called when the GR has changed.

- QPixmap [generatePixmap](#) ()
Generates a pixmap with a score.

3.8.1 Detailed Description

A QWidget displaying one/several pages of a Guido Score. You can navigate through the pages of the score using `setPage` function. You can have information on the number of pages in the score ([pageCount\(\)](#)) and the format of the pages (`pageSizeMM(int)`, [heightForWidth\(\)](#)).

The pages of the Guido Score will be displayed in a "grid of pages":

- you can specify the number of columns and lines of this grid with the `setGridHeight` / `setGridWidth` functions ;
- the pages are placed in the grid in increasing order of indexes ; the first page is at the top-left, the second page is placed at the right of the first page, and so on, until the end of the line, when it goes on on the next line ;
- you can specify the first (top left) displayed page with the `setPage` function.
- if the grid is too small to display all the Guido Score pages, it doesn't matter : other pages are simply not visible, and you have to use `setPage` to display them. See [QPageManager](#) for more details.

Warning

Don't forget to use `QGuidoPainter`'s static `startGuidoEngine` method, or else you'll have an assertion failed in the [QGuidoWidget](#) constructor.

3.8.2 Member Function Documentation

3.8.2.1 QString QGuidoWidget::gmncode () const

Returns the current Guido code.

Note

This will work only if the code has been set with `setGMNCODE`. If the code has been loaded via `setFile`, this will return "".

3.8.2.2 QSizeF QGuidoWidget::pageSizeMM (int page) const

Returns the size of the specified page, in millimeters.

The page format & size are defined in the Guido Score file.

3.8.2.3 bool QGuidoWidget::setGMNCode (const QString & *gmnCode*, const QString & *path*)

Sets the current Guido code to draw.

Parameters

<i>gmnCode</i>	The Guido Music Notation code
<i>path</i>	The path to external ressources (typically the file path for file based code)

Returns

true if the GMN code is valid.

3.8.2.4 bool QGuidoWidget::setGMNFile (const QString & *fileName*)

Sets the current Guido Score file to draw.

Parameters

<i>fileName</i>	Full path to the Guido Score Notation file.
-----------------	---

Returns

true if the file is a valid Guido Score file.

Note

If any GMN code has been previously set, it will be erased.

3.8.2.5 void QGuidoWidget::setGuidoLayoutSettings (const GuidoLayoutSettings & *layoutSettings*)

Sets the Guido layout settings used to draw with this [QGuidoPainter](#).

Note

You can have more informations on GuidoLayoutSettings in GUIDOlib documentation.

3.8.2.6 bool QGuidoWidget::setPage (int *pageIndex*)

Sets the first displayed page of the Guido Score.

Returns

True if the pageIndex is valid, false else.

The documentation for this class was generated from the following files:

- QGuidoWidget.h
- QGuidoWidget.cpp

3.9 QPageManager Class Reference

Arranges a set of pages in a grid.

```
#include <QPageManager.h>
```

Public Member Functions

- [QPageManager](#) ()
Default constructor.
- virtual [~QPageManager](#) ()
Destructor.
- void [setPages](#) (const QList< QSizeF > &pages)
Sets the set of pages.
- void [setGridHeight](#) (int height)
Sets the height of the grid (<=> number of lines)
- void [setGridWidth](#) (int width)
Sets the width of the grid (<=> number of columns)
- bool [setPage](#) (int index)
Sets the index of the first visible page.
- QSizeF [pageSize](#) (int index) const
Returns the size of the page (as defined by setPages)
- QPointF [pagePos](#) (int pageIndex) const
Returns the position of the page.
- QSizeF [totalSize](#) () const
Returns the current total size of the grid of pages.
- float [lineHeight](#) (int lineIndex) const
Returns the height of a line defined by its index.
- float [columnWidth](#) (int columnIndex) const
Returns the width of a column defined by its index.
- int [firstVisiblePage](#) () const
Returns the first visible page (top-left of the grid) index.
- int [lastVisiblePage](#) () const
Returns the last visible page (bottom-right of the grid) index.

- `int gridWidth () const`
Returns the grid's width (<=> number of columns)
- `int gridHeight () const`
Returns the grid's height (<=> number of lines)

3.9.1 Detailed Description

Arranges a set of pages in a grid. Basically: 1. give a set of pages to the [QPageManager](#) (`setPages`) (a page is defined by its size), 2. specify the number of lines/columns of the grid of pages (`setGridHeight` / `setGridWidth`) ; 3. define the first visible page (`setPage`) ; 4. then the [QPageManager](#) can tell you the position of each page in the grid.

The pages are placed in the grid in increasing order of indexes ; the first page is at the top-left, the second page is placed at the right of the first page, and so on, until the end of the line, when it goes on on the next line.

The total number of pages may be greater than `gridWidth() * gridHeight()` ; you can get the `firstVisiblePage()` and the `lastVisiblePage()`. Other pages are just considered as non-visible at that moment.

Each line has its own height, which is the one of the highest item of the line. Each column has its own width, which is the width of the item with the biggest width of the column.

Notes:

- `lineIndex` & `columnIndex` start at 0.
- `pageIndex` starts at 1 (like in a book).

3.9.2 Member Function Documentation

3.9.2.1 `QPointF QPageManager::pagePos (int pageIndex) const`

Returns the position of the page.

If the page is not visible, returns (-1,-1).

3.9.2.2 `QSizeF QPageManager::pageSize (int index) const`

Returns the size of the page (as defined by `setPages`)

Warning

The index parameter starts with 1 and no more with 0 (in opposition with the `setPages` function)

3.9.2.3 void QPageManager::setGridHeight (int *height*)

Sets the height of the grid (\leq number of lines)

If invalid argument (≤ 0), does nothing.

3.9.2.4 void QPageManager::setGridWidth (int *width*)

Sets the width of the grid (\leq number of columns)

If invalid argument (≤ 0), does nothing.

3.9.2.5 bool QPageManager::setPage (int *index*)

Sets the index of the first visible page.

Returns

False if invalid index.

The documentation for this class was generated from the following files:

- QPageManager.h
- QPageManager.cpp
